Project Description:

MOSS' work for Borgess Hospital in Kalamazoo, MI, has been ongoing for 20 years, and the relationship has evolved through several generations of technology. Most recently, the MOSS team has provided station cabling for various applications, such as:

- Diagnostic imaging
- Radiology
- General work stations

Working in a health care environment requires special considerations. First, MOSS must be particularly flexible in its scheduling, willing to work "off times" in each department. Everyone working on site must also be concerned about infection control and be able to work under cramped conditions in a tented, clean environment. Documentation has to be scrupulous; fire-stopping procedures must be followed to the letter.

Product Solution:

Systemax:

- Giga-speed cabling
- Laser-speed fiber
- Tera-speed fiber

Unique Conditions:

MOSS has a proven ability to work in a medical environment with the special needs listed above, without disrupting service for customers and patients 24/7.

Results/Benefits:

Borgess has a well-documented structured cabling solution with a 25-year warranty that is capable of handling today's and tomorrow's needs.

Making technology work for business.
